NuMega SmartCheck 6.2.1286 RC2 (Portable).rar

[Download](#)

---

I wrote the first version of BoundsChecker 6 in its current form in early 2000. I wanted to see if there was any way I could detect if a user changed any of the settings of the application from one version of the product to the next. I built it to look for VB6.0 properties that were changed from one version to the next and provided settings where it would not change or change to the same setting. BoundsChecker 6 works on all Visual Basic 6.0 applications, not just forms. I did the same thing for Visual Basic 2005 a few years back. I have even been able to write an add-in that looks for applications that are doing DirectShow or Image Validation. No matter what, the idea is to not change the settings from one version to the next unless you think you really need to do it. Like I said, the idea was to see if I could detect if a user changed any of the settings for a new version of the application, no matter what the settings were, and then provide information where the settings were changed. The first release of BoundsChecker 6 did not work that way. It was very simple to detect changed settings and provided a report of what changed. I wanted to change the program to do it differently and make it more like the other products in the product line, including the SmartCheck tool. NuMega SmartCheck 6.2.1286 RC2 (Portable).rar! The first version of BoundsChecker 6 worked perfectly, but it was very primitive. Early versions of BoundsChecker would only look for settings that were changed, and provide information where those settings were changed. A menu appeared to you in Visual Basic with all of the options of the application. You could drill down the menus until you got to the component you were interested in. This was a good solution, but not very ideal. It did not really tell you where the settings were changed from version to version. The menus were the same for each version. The results were simply put on the form.

## NuMega SmartCheck 6.2.1286 RC2 (Portable).rar!

The numbers you give for the initialization parameters to SmartCheck.exe in your app.config is the amount of code coverage you want SmartCheck to compile and run. This amount of code coverage will give you the most coverage for the cost, which is what really matters. For people using the Portable version, there are a couple of things you need to be aware of. The first is that it is very hard to find the exact place in the Portable version of SmartCheck.exe where to put your coverage numbers. I try to put it where it makes the most sense (in terms of debugging experience) but sometimes these are more complicated than I would like. The second is that you cannot run multiple instances of SmartCheck in the portable version. If you do and have multiple app.config values, only the last one will get read by the app.config. So far this column has covered how to use BoundsChecker to catch error before they cause heap corruption. In the next column, I will talk about how I use BoundsChecker on a daily basis. If you have any questions, feel free to send me an email. I will be happy to explain the many reasons why I use SmartCheck and how I use it, including where to get it, how to install it, and what to do after installing it. While developing I tend to only use BoundsChecker with FullCoverage and CodeWalker. BoundsChecker in conjunction with FullCoverage is just too good a tool to not use. I have a lot of experience using BoundsChecker and BoundsChecker in conjunction with CodeWalker so I rarely have any issues. I will usually not use CodeWalker and BoundsChecker when I am developing because I am writing code that is tested and tested again. I have never really used NuMega TrueCoverage in conjunction with BoundsChecker before, I haven't gotten the chance to really use it outside of what they stated it was designed for. 5ec8ef588b
