12Ghosts Backup is a utility that can let you create backups of your documents in a safe and efficient way. This software allows you to create multiple backups, each one of them in a specific location and keeping their version history. This feature can be easily accessed by navigating to the corresponding section of the application's interface and choosing how many backups to keep. One thing to be careful about is that not all versions of your documents will be automatically backed up, as it only performs a backup copy of the newest version of the document and does not keep track of older versions. That being said, it is possible to save older versions of your documents in specific locations, but you should be aware that this means having multiple copies of the same document in different folders, so you should decide how important it is to you before you proceed. In addition to keeping copies of your documents, 12Ghosts Backup allows you to perform backup copies of your files, either Full Backup or HyperBackup. In both cases, the utility creates a new folder in the destination path and saves files inside it. However, Full Backup copies every file in the source path and can be a rather slow process, while HyperBackup only copies files with specific extensions, like images or audio/video files. These are just some of the features that 12Ghosts Backup is known for, and more information about it can be found on its official website, which provides you with a free demo version of the software. System Requirements: 12Ghosts Backup is a reliable application that can easily be installed on your computer. In order to do so, you need to launch the setup package, accept the End User License Agreement, specify a destination path on your computer and follow the on-screen instructions provided by the installer. The only thing that you need to be careful about is that you are not using an unsupported OS version. Resolution: Open the folder where you have saved the file and open the DOCX file in your default word processor. Note: if you want to remove all formatting that is associated with your word processor, you should follow these steps. - Remove all format codes from the DOCX file by entering the following keyboard combination: Alt + Ctrl + Shift + Click on the Bold button and insert the code required. Click on the Bold button again to confirm the format change. Click on the Insert Hyperlink button and select the preferred destination website. NOTE: You can use the Web Browser to open the links.

For others, you may have to customize the setup process to assign a keystroke or a shortcut to the macro, and you may need to enable macros for each file or folder.
